Albert Ashaba Aheebwa

Node Js Terminologies.

Nodejs
It's a JavaScript runtime environment. It's open-source and cross platform.

Express
It's a Nodejs framework that provides a robust set of features e.g. server rendering for our web and mobile apps.

Pug
It's a templating language that will help us develop dynamic HTML

Dependencies
These are installed node packages from npm that help our apps run. Without them our apps cannot run.

Module
Consider modules to be the same as JavaScript libraries. A set of functions you want to include in your application.

const express = require("express")
This is a method of importing modules in commonjs.

This is similar to: - import express in other languages like python.

.gitignore
In here we specify what folders/files we don't want to push to GitHub. It's a good idea to ignore node_modules because it is a huge file.

npm install -g packageName
This command installs the package globally. In that it is now available in any directory we might be in.

Package.json
It's a file created after initializing a node project that has all the information about our project. i.e. author, app version number, dependencies, license type, etc.
